

Post-Incident Report: INC-2026-0117

Production outage, EU cluster | Severity 1 | Prepared by Platform Reliability, 6 February 2026

Summary

On 4 February 2026 the EU production cluster returned HTTP 503 for all API traffic for 47 minutes. Approximately 400 users across 11 customer tenants were unable to work. Two customers breached their contractual service level and are entitled to service credits under their agreements.

Timeline

Time (UTC)	Event
09:12	Load balancer node lb-eu-03 begins failing health checks; traffic not drained
09:14	Automated alert fires; on-call engineer paged
09:21	Incident declared; status page updated to "investigating"
09:34	Root cause identified as exhausted file descriptors after config push 2026.02.3
09:48	Traffic drained to secondary region; error rate begins falling
09:59	All tenants confirmed healthy; incident moved to monitoring
10:31	Incident closed; post-incident review scheduled

Impact

Tenant	Users affected	Downtime (min)	SLA breached	Credit due (USD)
Cedar Health	400	47	Yes	1,240.00
Acme Logistics	120	47	Yes	860.00
Pinnacle Finance	85	31	No	0.00
Orion Manufacturing	60	47	No	0.00
Vertex Media	44	22	No	0.00

Root cause

Configuration push 2026.02.3 raised the connection pool size without a matching increase to the file descriptor limit. Node lb-eu-03 exhausted descriptors under normal morning load. Health checks correctly marked the node unhealthy, but the drain automation required a quorum of two unhealthy nodes before acting, so traffic continued to route to the failed node.

Corrective actions

Action	Owner	Due date	Status
Raise file descriptor limit across all LB nodes	Platform	07 Feb 2026	Complete
Remove quorum requirement from drain automation	Platform	14 Feb 2026	In progress
Add descriptor utilisation to pre-push checks	Release	21 Feb 2026	Not started
Issue service credits to affected tenants	Finance	28 Feb 2026	Not started
